

## New technology to boost the drilling industry

9 October 2009   

CORETRACK has announced that it has completed building its Core Level Recorder System (CLRS).

The company says the tool took three years of meticulous research and development as well as advanced bench and well testing of crucial tool components.

The company says that during this period, the well testing was conducted with the assistance of a number of major national and international oil companies both in Australia and abroad.

The CLRS constitutes cutting edge technology for the oil and gas exploration sector and it is the only tool available that provides real time core acquisition data to the rig floor.

The completed system is currently undergoing final bench, heat and pressure testing.

Managing Director, Nanne van't Riet says years of hard work are coming to fruition. The company will now approach oil and gas companies to use this exciting technology in upcoming local and international coring work.
